

Adventure Game Project Report

Python Course-End Project

Student: *Juan Benítez*

Project Overview

This project implements a text-based adventure game in Python. The player explores either a dark forest or a mysterious cave in search of a legendary treasure. The game uses user input, functions, conditionals, loops, and modular programming to create an interactive command-line experience.

Project Objectives

The objective of the project was to practice fundamental Python programming by creating an interactive game that demonstrates variables, functions, user input, conditionals, loops, and reusable code.

How GitHub Copilot Assisted

- Suggested function templates and program structure.
- Assisted with organizing the code into reusable functions.
- Suggested improvements to readability and formatting.
- Helped refine conditional logic and replay functionality.
- Assisted with writing comments and documentation.

Challenges Encountered

- Understanding the difference between defining and calling functions.
- Organizing functions before the main program.
- Validating user input.
- Designing multiple game paths while keeping the code organized.

Enhancements Made

- Added a professional title screen.
- Improved the storyline and game flow.
- Added input validation for player choices.
- Added an adventure summary screen.
- Implemented replay functionality using a while loop.
- Added function docstrings and improved code organization.

Python Concepts Demonstrated

Variables, strings, user input, functions, parameters, return values, if/elif/else statements, while loops, modular programming, formatted strings (f-strings), and input validation.

Conclusion

The completed adventure game satisfies the project requirements while demonstrating clean coding practices, modular design, and effective use of fundamental Python programming concepts. GitHub Copilot was used as a development assistant to improve productivity while the final implementation and testing were completed by the student.
